Abstract

The purpose of this descriptive study was to compare the self-esteem between fertile and infertile Chinese woman. The study subjects consisted of 50 fertile women attending the gynecological clinic for 6 weeks postpartum check-up and 50 infertile women attending the infertile clinic at the First and Second Teaching hospitals of Xi'an Medical University, Shaanxi province hospital

VIII

Xi'an city hospital, and the Maternal and Child health center during December 1997 to February 1998. The instrument used for data collection was the Rosenberg Self-esteem Scale. The reliability was obtained by means of Cronbach's alpha coefficient at 0.70. Descriptive statistics and t-test were used for data analysis.

The result of this study revealed that the mean score of self-esteem in the fertile group was statistical significantly higher than the infertile group at .01 level.
